

# MATH2221

## Mathematics Laboratory II

### Lecture 2: Basic MATLAB Functions and MATLAB Scripts

**Gary Choi**

January 14, 2025

# Recall: What is MATLAB?

- **Calculator x Programming language x Interactive visualization and control tool**
  - Facilitate **matrix** and vector computations
  - Easy-to-use visualization tools
  - Easier to program than C/C++/Python/...

# Recall: Basic operations in MATLAB

$d = [2 \ 3 \ 4]$

Define a row vector (note: need **square bracket [ ]**)

$C = [3 \ 1 \ 1; 0 \ 2 \ 4; -1 \ 0 \ 1]$

Define a 3-by-3 matrix (note: use **semicolon ;** to start a new row)

$e = d'$

$e$  is the transpose of  $d$

$3 * C$

Scalar multiplication

$C * e$

Matrix-vector product

$C * C$

Matrix-matrix product

$C^2$

Square of a matrix

# Some basic commands in MATLAB

Description	MATLAB Command	Example
MATLAB documentation	<code>demo</code>	<code>demo</code>
Displays the help text for the functionality	<code>help</code>	<code>help primes</code>
Clear a variable	<code>clear</code>	<code>a = 1;</code> <code>clear a</code>
Clear all variables	<code>clear all</code>	<code>clear all</code>
Clear command window	<code>clc</code>	<code>clc</code>

# Some basic functions and special values in MATLAB

Description	MATLAB Command	Example
Square root	<code>sqrt</code>	<code>sqrt(9)</code>
Exponential	<code>exp</code>	<code>exp(2)</code>
Natural logarithm	<code>log</code>	<code>log(24)</code>
Common (base 10) logarithm	<code>log10</code>	<code>log10(100)</code>
Absolute value	<code>abs</code>	<code>abs(-1.5)</code>
$\pi$	<code>pi</code>	<code>pi^2</code>
Infinity $\infty$	<code>Inf</code>	<code>1/Inf</code>

# Rounding and number theoretic functions in MATLAB

Description	MATLAB Command	Example
Round	<code>round</code>	<code>round(6.1)</code>
Floor function	<code>floor</code>	<code>floor(4.9)</code>
Ceiling function	<code>ceil</code>	<code>ceil(3.2)</code>
Remainder after division	<code>mod</code>	<code>mod(7,3)</code>
Factorial $n!$	<code>factorial</code>	<code>factorial(6)</code>
Binomial coefficient	<code>nchoosek</code>	<code>nchoosek(4,2)</code>
Prime factorization	<code>factor</code>	<code>factor(12)</code>

# Trigonometric and hyperbolic functions in MATLAB

Description	MATLAB Command	Example
Sine	<code>sin</code>	<code>sin(pi/6)</code>
Cosine	<code>cos</code>	<code>cos(pi/4)</code>
Tangent	<code>tan</code>	<code>tan(pi/3)</code>
Inverse sine (arcsin)	<code>asin</code>	<code>asin(sqrt(3)/2)</code>
Inverse cosine (arccos)	<code>acos</code>	<code>acos(1/2)</code>
Inverse tangent (arctan)	<code>atan</code>	<code>atan(1)</code>
Hyperbolic sine	<code>sinh</code>	<code>sinh(pi/6)</code>
Hyperbolic cosine	<code>cosh</code>	<code>cosh(1)</code>
Hyperbolic tangent	<code>tanh</code>	<code>tanh(pi/4)</code>
Inverse hyperbolic sine	<code>asinh</code>	<code>asinh(0.5)</code>
Inverse hyperbolic cosine	<code>acosh</code>	<code>acosh(0.5)</code>
Inverse hyperbolic tangent	<code>atanh</code>	<code>atanh(0.5)</code>

# Functions related to complex numbers in MATLAB

Description	MATLAB Command	Example
$\sqrt{-1}$	i or j or 1i or 1j	2 + 1i
Absolute value (modulus)	abs	abs(2+3*1i)
Phase angle (in radians)	angle	angle(1+1i)
Complex conjugate	conj	conj(4+5*1i)
Real part	real	real(2+3*1i)
Imaginary part	imag	imag(4-5*1i)

# Vector commands in MATLAB

Description	MATLAB Command	Example
Create a row vector with entries from m to n with an increment of 1	<b>m:n</b>	<b>1:3</b> = [1,2,3] <b>(3:6)'</b> = [3;4;5;6]
Create a row vector with entries from m to n with an increment of s	<b>m:s:n</b>	<b>1:2:10</b> = [1,3,5,7,9] <b>20:-5:1</b> = [20, 15, 10, 5]
Obtain the length of the vector	<b>length(v)</b>	<b>length([2,3,5])</b> = 3 <b>length(0:pi:100)</b> = 32

# Vector commands in MATLAB

```
>> 1:5
```

```
ans =
```

```
1 2 3 4 5
```

Use colon “**m:n**” (where  $n > m$ ) to create a row vector with entries from **m** to **n** with an increment of 1

```
>> 3:0.2:4
```

```
ans =
```

```
3.0000 3.2000 3.4000 3.6000 3.8000 4.0000
```

Use colon “**m:s:n**” to create a row vector with entries from **m** to **n** with an increment of **s**

```
>> a = 5:-1:-3
```

```
a =
```

```
5 4 3 2 1 0 -1 -2 -3
```

Negative increment can also be used

```
>> 0:pi:10
```

```
ans =
```

```
0 3.1416 6.2832 9.4248
```

Values outside the interval will not be included

# Matrix commands in MATLAB

Description	MATLAB Command	Example
m-by-m zero matrix	<code>zeros(m)</code>	<code>zeros(2)</code> = 2-by-2 zero matrix
m-by-n zero matrix	<code>zeros(m,n)</code>	<code>zeros(4,3)</code> = 4-by-3 zero matrix
m-by-m matrix of ones	<code>ones(m)</code>	<code>ones(2)</code> = $\begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$
m-by-n matrix of ones	<code>ones(m,n)</code>	<code>ones(1,3)</code> = $[1 \quad 1 \quad 1]$
m-by-m identity matrix	<code>eye(m)</code>	<code>eye(2)</code> = $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
m-by-n matrix with 1's on the diagonal and 0's elsewhere	<code>eye(m,n)</code>	<code>eye(2,3)</code> = $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$
m-by-m random matrix	<code>rand(m)</code>	<code>rand(2)</code> = 2-by-2 random matrix
m-by-n random matrix	<code>rand(m,n)</code>	<code>rand(4,3)</code> = 4-by-3 random matrix
Obtain the size of the matrix	<code>size(A)</code>	<code>size([1,2; 3 4; 5 6])</code>

# Matrix commands in MATLAB

```
>> M = zeros(2,4)
```

```
M =
```

```
0  0  0  0
0  0  0  0
```

Creating a zero matrix with 2 rows and 4 columns

```
>> A = ones(3,2)
```

```
A =
```

```
1  1
1  1
1  1
```

Forming a matrix with 3 rows and 2 columns, with all values = 1

```
>> B = ones(2)
```

```
B =
```

```
1  1
1  1
```

Will assume the matrix is a square matrix if only one input is given

# Matrix indexing in MATLAB

```
>> A = [1, 2, 3, 4; 5, 6, 7, 8];
```

```
>> A(2,3)
```

```
ans =  
    7
```

```
>> A(2,:)
```

```
ans =  
    5    6    7    8
```

```
>> A(:,3)
```

```
ans =  
    3  
    7
```

```
>> A(1,end)
```

```
ans =  
    4
```

Define a 2-by-4 matrix A

Extract the entry  $A_{2,3}$

Use **colon** : to extract the entire row or column

Use **colon** : to extract the entire row or column

The **end** operator is an easy shorthand way to refer to the last element

# Matrix indexing in MATLAB

```
>> A = [1, 2, 3, 4; 5, 6, 7, 8];
```

```
>> A(2,2:4)
```

```
ans =
```

```
6 7 8
```

```
>> A([2,1],:)
```

```
ans =
```

```
5 6 7 8
```

```
1 2 3 4
```

```
>> A([2 1],[1 4 3 2 2])
```

```
ans =
```

```
5 8 7 6 6
```

```
1 4 3 2 2
```

Define a 2-by-4 matrix A

Extract row 2, column 2-4

Swapping row 1 and row 2

Create a matrix with some permutations and repetitions via more complicated indexing

For more examples, see:

<https://www.mathworks.com/company/technical-articles/matrix-indexing-in-matlab.html>

# Entrywise operations for vectors and matrices

- Adding/subtracting a scalar (e.g.  $[1,2,3] + 1$ ): entrywise
- Scalar multiplication (e.g.  $3*[1,2,3]$ ): entrywise
- In other cases, remember to add “.” for entrywise operations:
  - Entrywise multiplication  $A.*B$
  - Entrywise division  $A./B$
  - Entrywise exponentiation  $A.^B$
- Applying scalar functions to vectors and matrices: entrywise  
e.g.  $\sin(C)$ ,  $\exp(C)$ ,  $\text{sqrt}(C)$ ,  $\text{ceil}(C)$

# Entrywise operations for vectors and matrices

```
>> A = [1,2; 3 4];
```

```
>> B = [2,0; 2 5];
```

```
>> A.*B
```

```
ans =
```

```
2 0
```

```
6 20
```

Entrywise multiplication (i.e. having  $a_{ij} * b_{ij}$  for all  $i, j$ )

```
>> A*B
```

```
ans =
```

```
6 10
```

```
14 20
```

Usual matrix multiplication

```
>> A.^2
```

```
ans =
```

```
1 4
```

```
9 16
```

Entrywise power (i.e. having  $a_{ij}^2$  for all  $i, j$ )

# Other common vector and matrix functions

Description	MATLAB Command
Norm of vector $v$	<code>norm(v)</code>
Dot product	<code>dot(u,v)</code>
Cross product	<code>cross(u,v)</code>
Sum of entries of $v$	<code>sum(v)</code>
Matrix inverse of $A$	<code>inv(A)</code>
Determinant of $A$	<code>det(A)</code>
Eigenvalues of $A$	<code>eig(A)</code>
Norm of $A$	<code>norm(A)</code>
Diagonal part of $A$	<code>diag(A)</code>
Upper triangular part of $A$	<code>triu(A)</code>
Lower triangular part of $A$	<code>tril(A)</code>
Sum of entries of $A$ along columns or rows	<code>sum(A,1)</code> (columns) , <code>sum(A,2)</code> (rows)

# Other common vector and matrix functions

```
>> u = [4 -1 2];
```

```
>> v = [2 -2 -1];
```

```
>> dot(u,v)
```

Dot product

```
ans =
```

```
8
```

```
>> cross(u,v)
```

Cross product

```
ans =
```

```
5    8   -6
```

```
>> norm(u)
```

Norm

```
ans =
```

```
4.5826
```

# Other common vector and matrix functions

```
>> A = [1 3 5; 10 -2 3; 2 3 4]
```

```
A =
```

```
    1    3    5  
   10   -2    3  
    2    3    4
```

```
>> det(A)
```

Determinant

```
ans =
```

```
    51
```

```
>> inv(A)
```

Matrix inverse

```
ans =
```

```
  -0.3333    0.0588    0.3725  
  -0.6667   -0.1176    0.9216  
   0.6667    0.0588   -0.6275
```

# Other common vector and matrix functions

```
>> A = [1 3 5; 10 -2 3; 2 3 4]
```

```
A =
```

```
    1    3    5  
   10   -2    3  
    2    3    4
```

```
>> diag(A)
```

Diagonal entries

```
ans =
```

```
    1  
   -2  
    4
```

```
>> eig(A)
```

Eigenvalues

```
ans =
```

```
    9.4162  
   -5.4162  
   -1.0000
```

# Other common vector and matrix functions

```
>> A = [1 3 5; 10 -2 3; 2 3 4]
```

```
A =
```

```
    1    3    5  
   10   -2    3  
    2    3    4
```

```
>> triu(A)
```

Upper triangular part

```
ans =
```

```
    1    3    5  
    0   -2    3  
    0    0    4
```

```
>> tril(A)
```

Lower triangular part

```
ans =
```

```
    1    0    0  
   10   -2    0  
    2    3    4
```

# Solving matrix equation: $x = A \setminus b$

- In MATLAB, we can solve a matrix equation  $Ax = b$  by simply typing  $x = A \setminus b$
- Note: ( $\setminus$ ) is the backslash operator, should not be mixed up with division ( $/$ )

Example:

```
>> A = [1,2; 3 4];
```

```
>> b = [9; 10];
```

```
>> A\b
```

```
ans =
```

```
-8.0000
```

```
8.5000
```

Example:

```
>> A = eye(10)+ones(10);
```

```
>> b = (1:10)';
```

```
>> x = A\b
```

x =

```
-4.0000
```

```
-3.0000
```

```
-2.0000
```

```
-1.0000
```

```
-0.0000
```

```
1.0000
```

```
2.0000
```

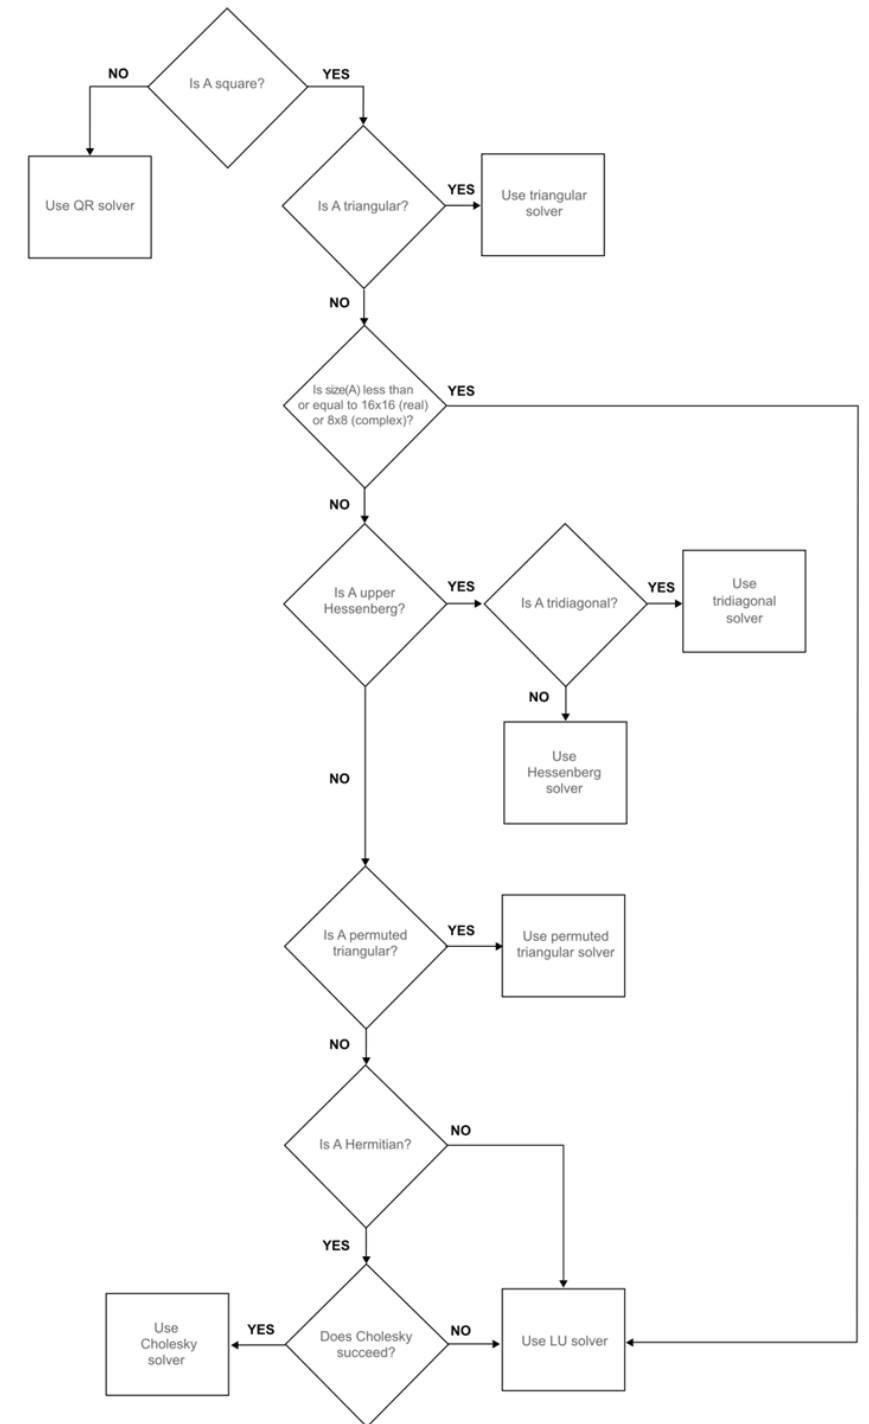

```
3.0000
```

```
4.0000
```

```
5.0000
```

# How does $x = A \setminus b$ work?

- MATLAB automatically checks the properties of the matrix  $A$  and finds a suitable method to solve the equation (see the flow chart)  
<https://www.mathworks.com/help/matlab/ref/double.mldivide.html>
- Remark:
  - In most cases,  $x = A \setminus b$  does not require explicitly finding  $A^{-1}$  and hence is much faster than  $\text{inv}(A)*b$  or  $A^{(-1)}*b$
  - Avoid the computation of matrix inverse unless it is necessary

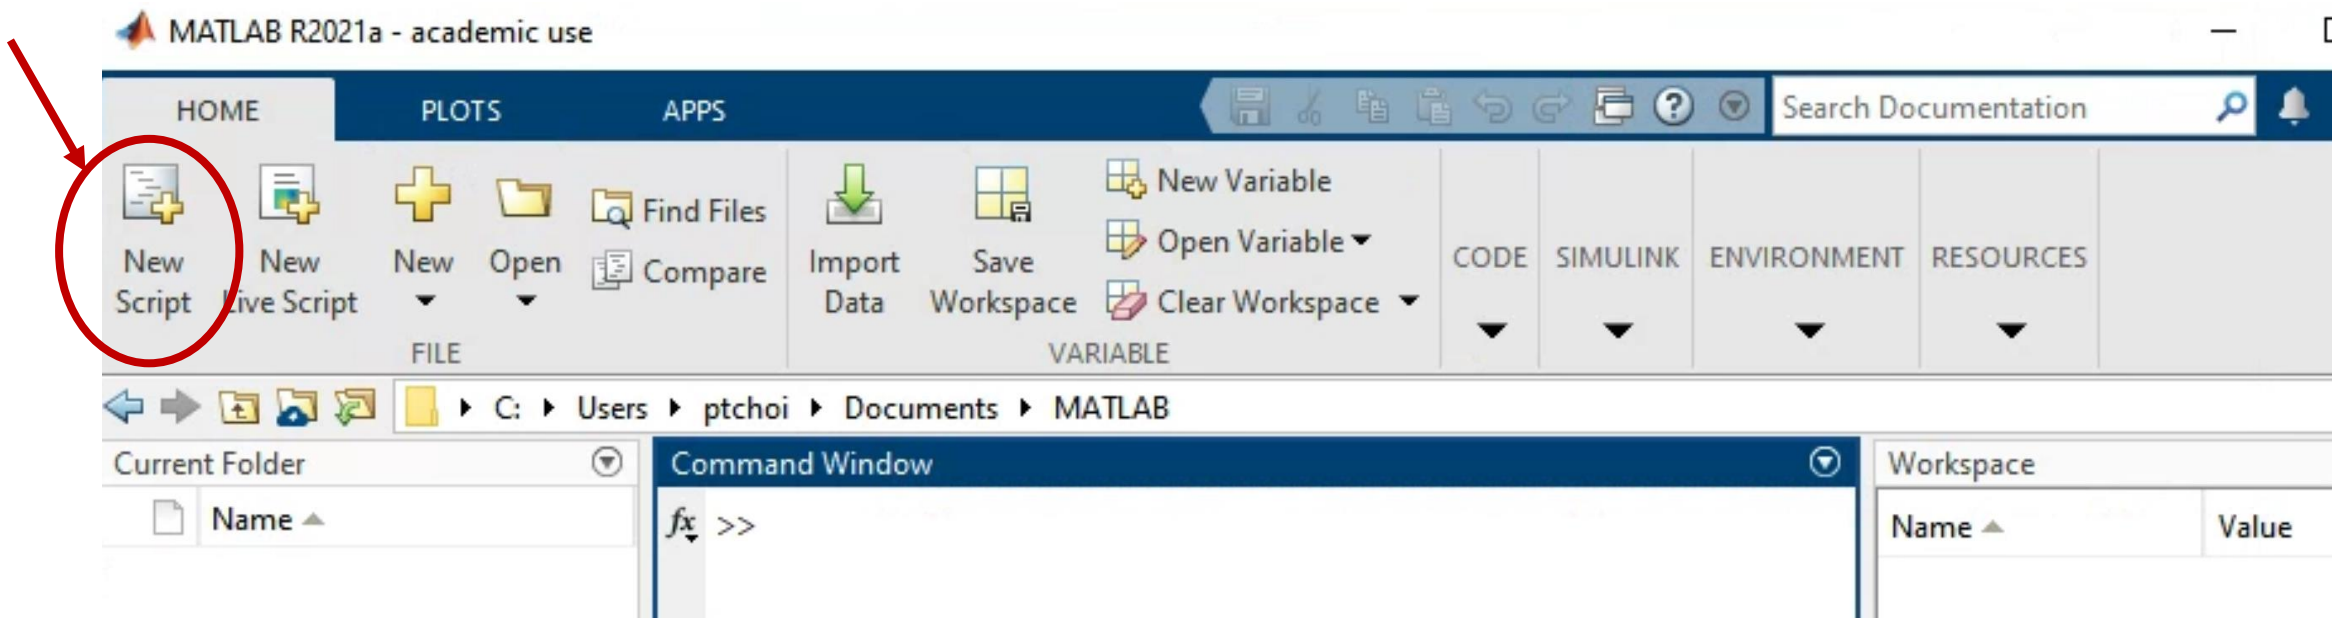

# MATLAB scripts

- What is a MATLAB script?
  - A file with a `.m` extension
  - Can execute a series of MATLAB statements
- What is a MATLAB script good for?
  - Save, edit and debug MATLAB programming code

# Creating a MATLAB script

- A new script can be created by clicking the new script button in the Home toolbar.

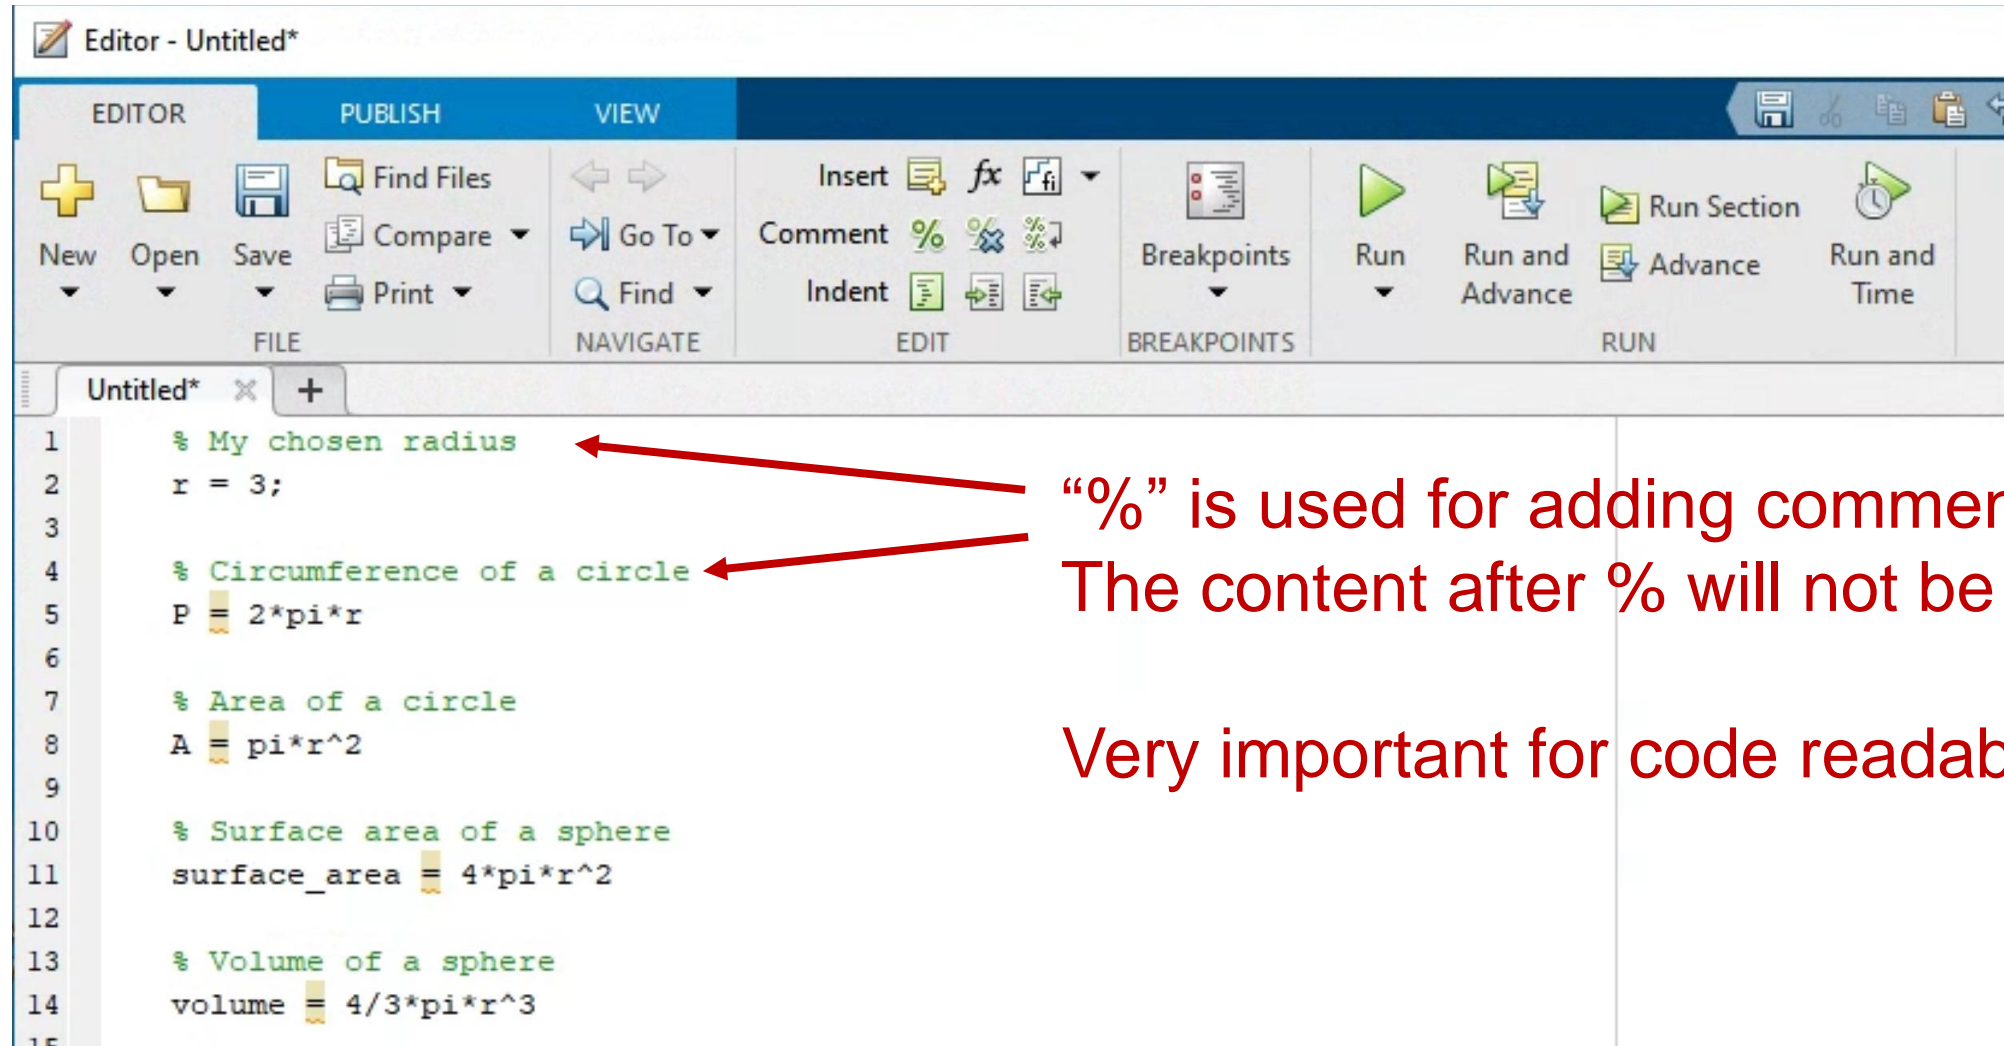

- It can also be created by pressing

# Creating a MATLAB script

- Once a script is created, MATLAB statements can be inserted line-by-line. When the script is run, each line of code will be executed sequentially.

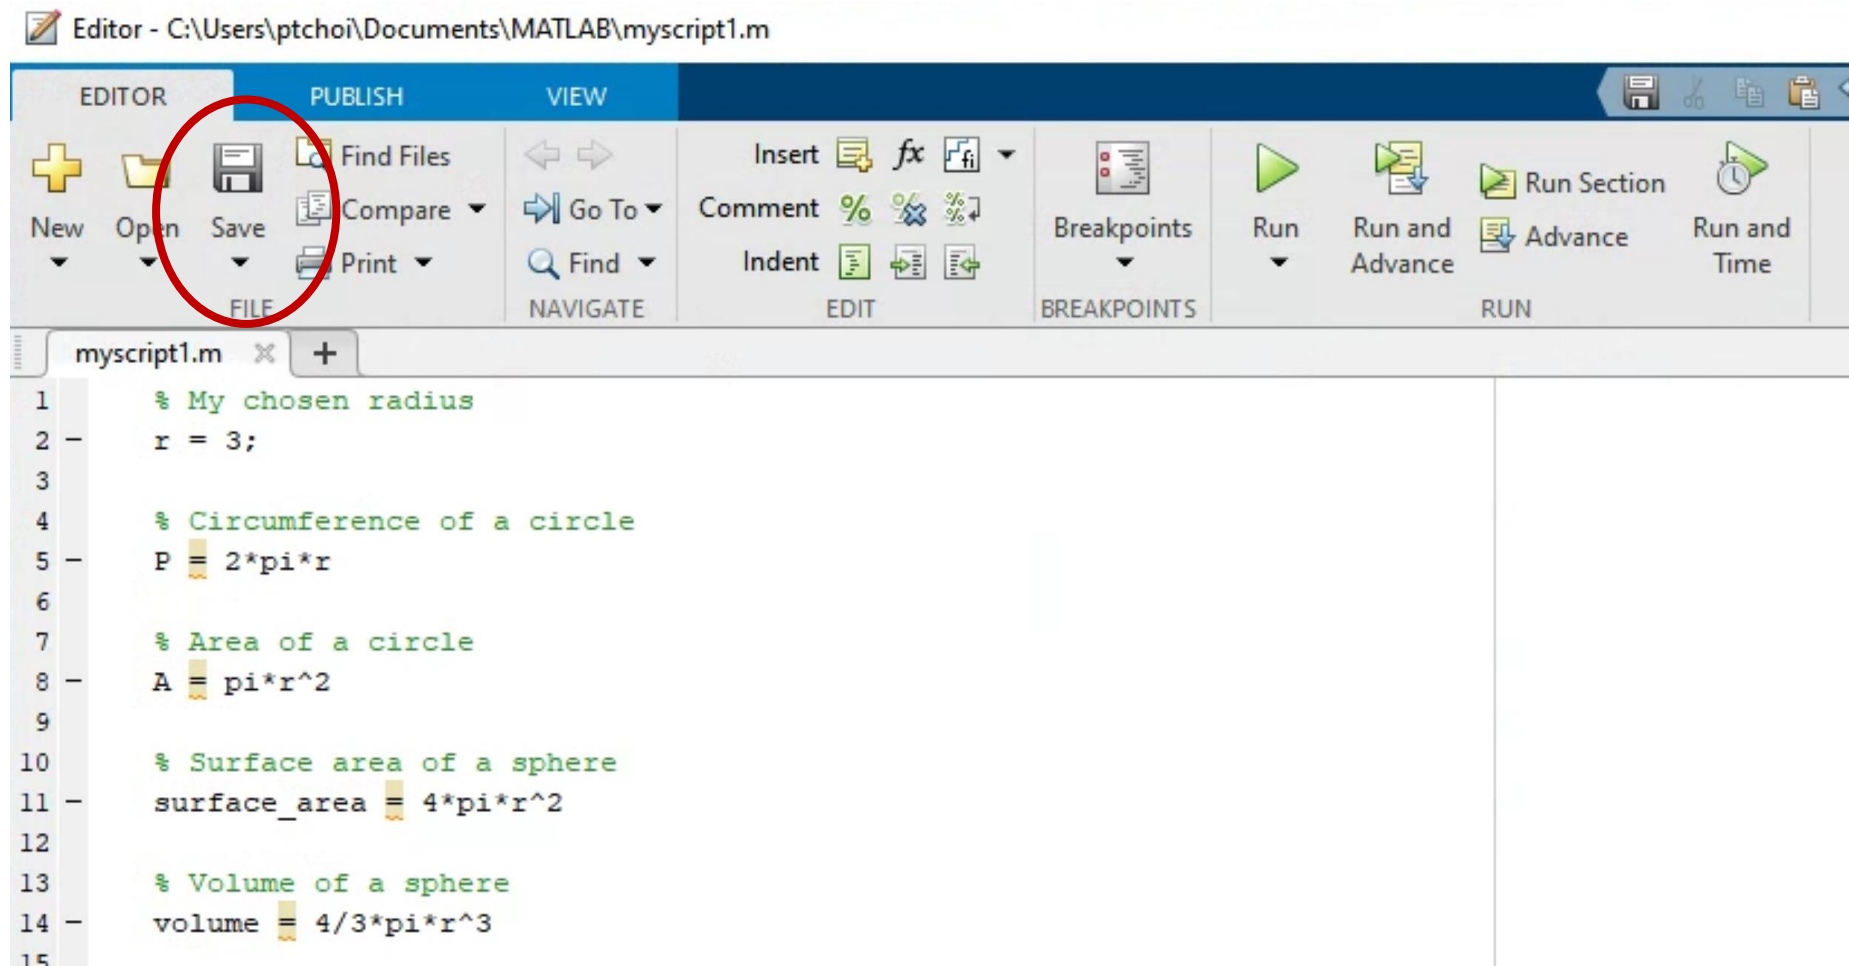

“%” is used for adding comments:  
The content after % will not be executed

Very important for code readability!

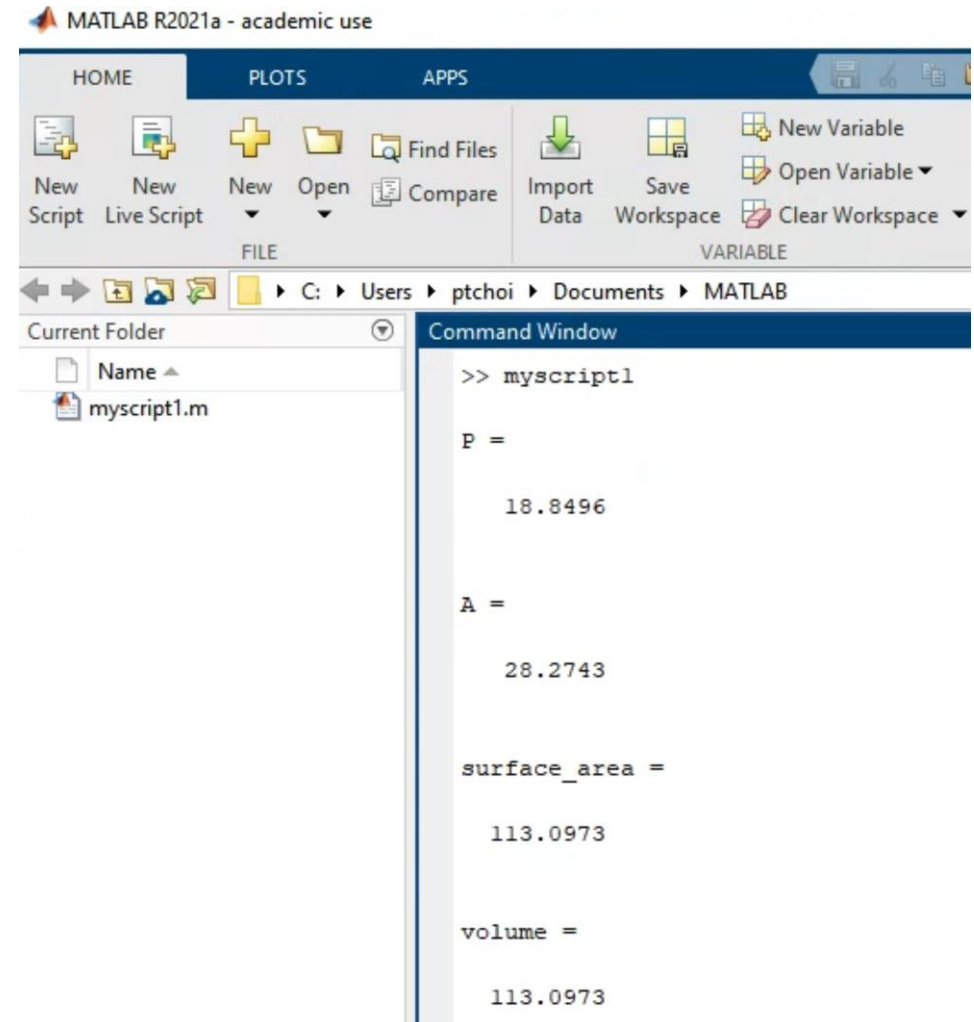

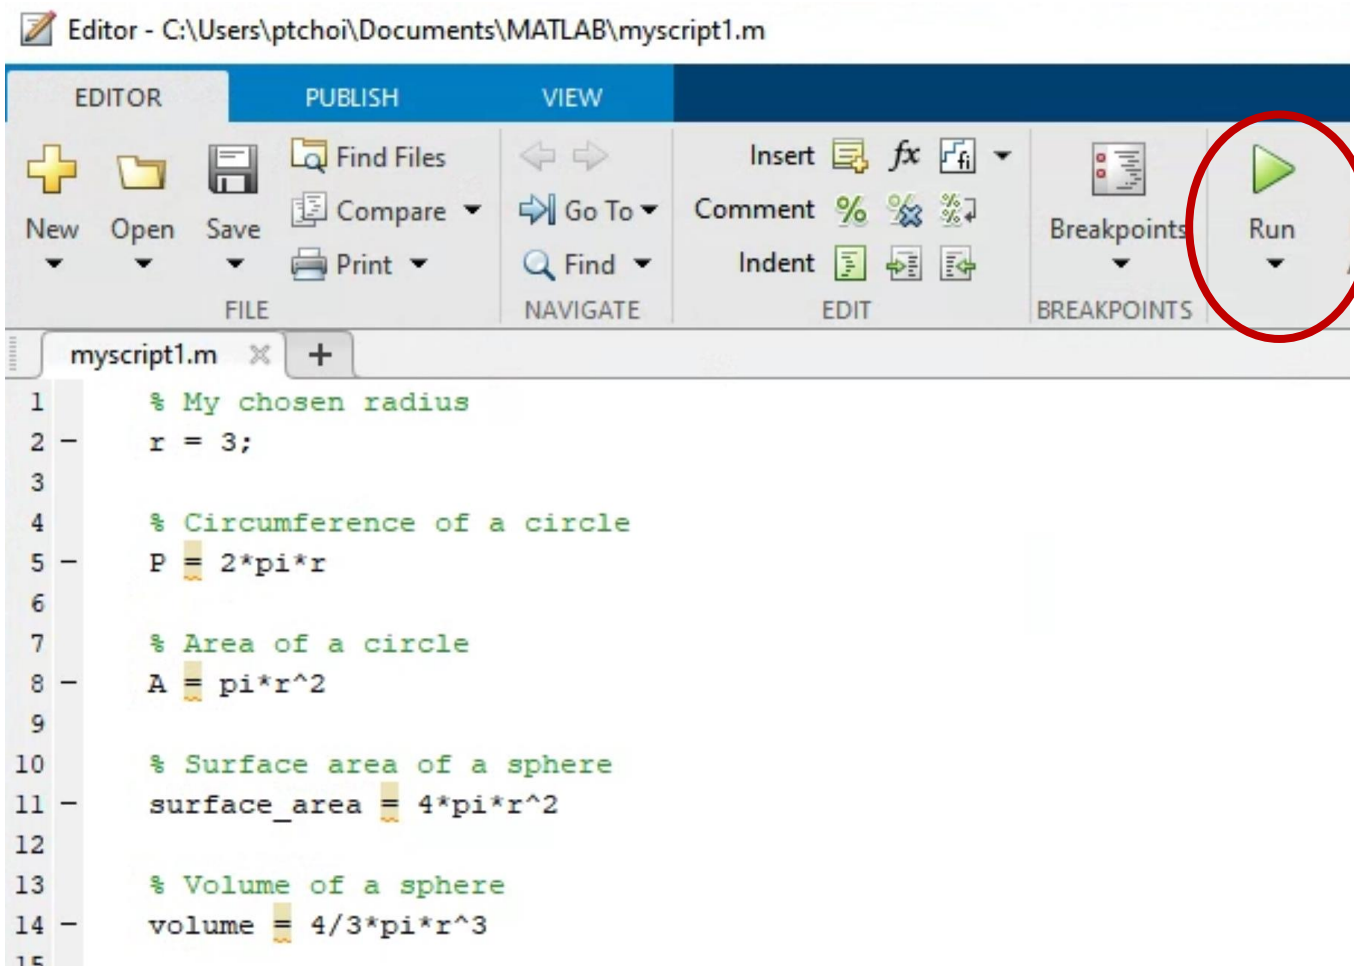

# Saving a MATLAB script

- Once a script is complete, it must be saved before it can be run. If you attempt to run an unsaved script, MATLAB will prompt you to save your script first. By default, MATLAB will save your script in the Current Folder.

# Running a MATLAB script

- Once the script is saved, we can run it by clicking the Run button or directly typing the script name and pressing Enter in the Command Window.

# Reminder: Lab session starting this week
